

What is a KVM switch? Why do I need one?

A KVM switch is an active device that allows multiple CPUs to share one Keyboard, Video display and Mouse. They save users money and desktop space because multiple components are not necessary to run the CPUs.

WITHOUT KVM SWITCH

- More equipment to buy and more space to take up

WITH KVM SWITCH

- Less equipment to buy and less space to take up
- Less power usage due to single monitor for multiple CPUs
